arXiv, Arch Linux, biblatex, biber

Posted by chathaway on Nov. 24, 2017, 5:30 p.m.

For the first time in years, an update was published to the biblatex package. This is quite exciting, but presents a problem for those of us who use "bleeding edge" software, like Arch Linux, and need to submit our papers to sites like arXiv, which use more stable packages. This is a quick work around.

The Problem

At the time of writing, there is a new version of biber and a new version of biblatex on my Arch system, which produces a .bbl file a version of "2.9". arXiv emits an error message, informing me that the bbl was expected to be version 2.8.

The Fix

Get an old version of biblatex, install it to ~/texmf

```
$ git clone https://github.com/plk/biblatex.git cd biblatex$ git checkout v3.7Previous HEAD position was 78e9451a... Bug fixesH
```

Get an older version of biber

```
$ wget https://archive.archlinux.org/packages/b/biber/biber-2.7-3-any.pkg.tar.xz$ sudo pacman -U biber-2.7-3-any.pkg.tar.xz
```

Compile the paper again

If you use git and didn't add the autogenerated gunk to your repo:

```
$ git clean -fd
```

Else, manually remove all files except the .tex, images, and other "human generated" files.

Compile the paper, and submit it

```
$ pdflatex main$ biber main$ pdflatex main$ pdflatex main
```

Huzzah!
